

Chapter 2 Review: Geometry

Textbook p70-106

Summary: p.84-85,105

Practice Questions p.106

Key Concepts:

Basic Rules

- 1) Angles on a line are Supplementary (add to 180°)
- 2) Angles within a right angle are Complimentary (add to 90°)
- 3) Angles at a point add to 360°
- 4) Vertically opposite angles are equal
- 5) All radii within a circle are equal
- 6) In an isosceles triangle, equal angles are opposite equal sides

Parallel Lines

- 1) Corresponding Angles are Equal ($1=5, 2=6, 3=7, 4=8$)
- 2) Alternate Interior Angles are Equal ($4=5, 3=6$)
- 3) Co Interior Angles are Supplementary ($3+5=180, 4+6=180$)

Angles in a Triangle

- 1) Angles in a Triangle Add to 180 Degrees ($1+2+3=180$)
- 2) The External Angle in a Triangle Equals the Sum of the Opposite Interior Angles ($4=2+3$)

Angles in a Polygon

- 1) The sum of the measures of the interior angles of a convex polygon with n sides can be expressed as $180^\circ(n-2)$.

Example: If a shape has 6 sides, then the sum of the interior angles is

$$= 180^\circ(6-2)$$

$$= 180^\circ(4)$$

$$= 720^\circ$$

That means that if all the angles are equal (it is a regular polygon and each angle is

$$720^\circ \div 6 = \underline{120^\circ}$$

- 2) The sum of the measures of the exterior angles of any convex polygon is 360° .

In a REGULAR polygon
 $\frac{360^\circ}{5} = 72^\circ$ for each angle

Key Example: Given that ABCDE is a regular pentagon, prove that $AC \parallel ED$

3)

Statement	Reason
$\angle ABC = \angle DCB = 108^\circ$	Interior angles of regular polygon
$\angle ACB = \angle CAB = 36^\circ$	Angles of a triangle (isosceles) = 180
$\angle ACD = 72$	$108 - 36 = 72$
$\angle EDC = 108$	Interior angles of regular polygon
$\angle ACD + \angle EDC = 180$	$108 + 72 = 180$
$AC \parallel ED$	Co-interior angles are supplementary

Note: It is important not to assume that the lines are parallel or use it as a reason early in the proof. That would be called circular reasoning (and be logically incorrect).

Chapter 2 Review: Geometry

Practice #1: Find each angle and give a reason.

$$\begin{aligned} \angle DIF &= 70^\circ \text{ vertically opposite} \\ \angle DIG &= 110^\circ \text{ Supplementary} \\ \angle BGI &= 70^\circ \text{ alternate interior} \\ &\quad \text{OR co-interior} \\ \angle HGI &= 55^\circ \text{ Supplementary } \div 2 \end{aligned}$$

Practice #2: Find each angle and give a reason.

$$\begin{aligned} \angle DCA &= 35^\circ \text{ angles of } \Delta = 180, \div 2 \\ \angle ADC &= 65^\circ \text{ angles of } \Delta = 180 \\ \angle EDA &= 115^\circ \text{ Supplementary} \\ \angle EDB &= 65^\circ \text{ vertically opposite} \\ &\quad \text{B (or supplementary)} \end{aligned}$$

Practice #3: Find each angle and give a reason

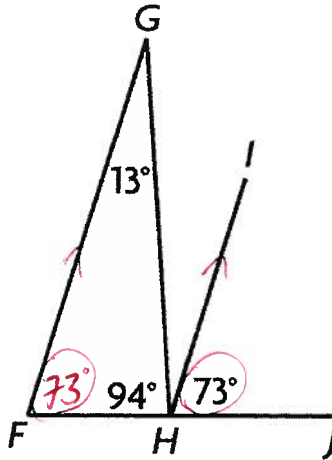

$$\begin{aligned} \angle ABD &= 55^\circ \text{ radii equal, isosceles} \\ \angle BDC &= 110^\circ \text{ Supplementary} \\ \angle BCD &= 35^\circ \text{ radii equal, isosceles} \\ \angle EDC &= 130^\circ \text{ Supplementary} \\ &\quad \text{(or angles from point)} \end{aligned}$$

Practice #4: Given $\angle UWX = \angle WYZ$, prove: $TV \parallel WX$

Statement	Reason
$\angle WYZ = \angle TUW = 37^\circ$	given in picture
$\angle UWX = \angle WYZ$	given
$\angle UWX = 37^\circ$	substitution
$\angle UWX = \angle TUW$	both = 37°
$TV \parallel WX$	alternate interior angles are equal

Practice #5: Prove: $FG \parallel HI$

Statement	Reason
$\angle GFH = 73^\circ$	\angle s in $\Delta = 180$
\angle $\angle IHJ = 73^\circ$	given in picture
$\angle GFH = \angle IHJ$	both = 73°
$FG \parallel HI$	corresponding angles are equal.

*could also pshow $\angle GHI$ is 13° , then use alt.int.

Practice #6: Determine the values of a , b , and c .

$$3a + 7a = 180$$

$$10a = 180$$

$$a = 18$$

$$3a = b$$

$$3(18) = b$$

$$b = 54$$

$$2c = b$$

$$2c = 54$$

$$c = 27$$

Practice #7: Determine the sum of the measures of the interior angles of this polygon.

$$n = 8$$

$$S = 180(n - 2)$$

$$S = 1080^\circ$$

Practice #8: Each interior angle of a regular convex polygon measures 162° .

How many sides does the polygon have?

$$162n = 180(n - 2)$$

$$162n = 180n - 360$$

$$360 = 18n$$

$$n = \frac{360}{18}$$

$$n = 20$$

Practice #9: The interior angles of a regular convex polygon add to 2340° .

How many sides does the polygon have?

$$2340 = 180(n - 2)$$

$$\frac{2340}{180} + 2 = n$$

$$n = 15$$

Practice #10: Determine the value of a , b , c , and d .

$$\frac{180(5 - 2)}{5} = 108^\circ$$

$$a = 36^\circ$$

$$b = 72^\circ$$

$$c = 72^\circ$$

$$d = 36^\circ$$
